PROJECT GURNEY MALAYSIA

Present rainwater harvesting systems

In fulfilment of our objective to assist underprivileged and rural communities through impactful engineering-based projects, we reached out to Kampung Gurney through our partner in EWB (Malaysia), Sanjiv.

Kampung Gurney is home to the Temuan indigenous people, one of the largest and most widespread Orang Asli ethnic groups in Malaysia. The community is currently made up of about 300 people.

Unreliable sources of water, coupled with heavily polluted groundwater in the region, has resulted in rampant shortage of potable water.

After discussion with Sanjiv, EWB (Singapore) came onboard to support the cause by conducting a recce in December 2023 to identify areas for improvement of existing rainwater harvesting systems.

Following up from the recce trip, EWB (Singapore) has installed a new rainwater harvesting systems for one house in Kampung Gurney in September 2024.

It was a challenging but fruitful experience for the Singapore team and the team is proud to have made a small but significant impact to the community.

We hope to continue this collaboration with EWB (Malaysia). So, stay tuned for project updates and opportunities!

Project Highlights

CARE CORNER ORPHANAGE CHIANGMAI, THAILAND

Care Corner Orphanage, located in Chiangmai,, functions as a care centre for children who are unable to attend school due to difficult family circumstances.

EWB (SG) performed a site recce in December 2023 to understand the concerns of the orphanage and came to the decision of exploring the possibility of adding an additional storey to the boys' building. This would allow the orphanage to accommodate more children from the region who require a shelter.

With this proposed improvement, we also aim to address some of the other existing problems such as the overflow of septic tanks and rainwater leaks through zinc sheet roofs.

Zinc sheet roofs susceptible to rainwater leaks

Since the start of 2024, we have been working with engineering consultants to review our design and will be recruiting volunteers with experience in building and affiliated services design in the near future.

At present, the CCO management is planning the soil sampling process and is in discussions with local contractors.

Project Highlights

Existing toilet shed in Batu Aji School with 2 working cubicles and 1 sink that serve close to 300 students

In April 2024, EWB (SG) was invited by the Yayasan Suluh Mulia Pionir Foundation to conduct a recce and identify areas for improvement of existing facilities in their schools.

We visited 3 of the schools run by the foundation, including Sekolah Suluh Aditya Bangsa (SSAB), which offers educational services from kindergarten (TK) up to junior high school (SMP).

In recent years since its establishment, the school has faced significant challenges in operations, which include an attack on its compound. Since the attack, SSAB has been actively raising funds to renovate its compound.

We have identified potential areas of assistance, such as the design and construction of a new guardhouse which can accommodate the guard and the family members, ensuring protection and safe operations of the school.

We also aim to improve the dire sanitation infrastructure in Batu Aji School, where only 2 cubicles serve the entire student body.

EWB (SG) is currently in the process of consolidating information gathered during the recce and preparing a report to determine the feasibility of these projects.

If you're keen to get involved, do sign up as a member on our website. For funding inquiries, please email us at corporate@ewb.sg. Join us in making a difference!
